THIS WEEK!

NOREMAT MAGISTRA The Ultimate Side Arm Mower

The new generation Magistra is designed to perform even in the most intensive verge maintenance work. Articulation technology for the Magistra range is based on that found in heavier construction and industrial applications; this ensures safe operation in all conditions. There is a wide range of reaches from 5.50 m to 8.30 m, a wide range of configurations - offset arm, Visiobra or telescopic arm - to ensure that there is a model ideally suited to each application. Robust and efficient, the Magistra range provides multipurpose equipment for professional users.

What does Noremat offer that others in the market don't?

FIXASPEED 'Y' FLAIL. Quick release mounting system for onsite flail replacement.

Rolmax Rotor for heavy branch and tree removal. Forestry hammer flails can rotate through 360 degrees. No need to change cutter head, just change rotor shafts.

Closed circuit piston pump technology was developed for machines where constant high-power is required. The increased hydraulic power available, due to the Closed circuit piston pump technology, of 73-84HP requires the use of a tooth-belt drive system. This belt-drive system gives a maintenance free life of 3000-5000 hours and positions the motor out of harm's way.

Floating mowing head position from Noremat. This system is switched on and off from the operators seat and even when activated the operator retains control over the cutting head position.

IDIOT of the WEEK!

Noremat Magistra - The Ultimate Side Arm Mower (continued..)

The Visiobra concept gives perfect vision for the operator with the road and the mowing head in the same field of vision. The telescopic section giving perfect control when the mower head extension needs adjustment.

Better stability and safety having the pivot point to the right of the tractor centre line gives more stability to the machine.

On a side-arm flail mower, the cylinders are normally single-acting, To prevent the arm tipping because of its own weight when it passes the vertical position Noremat have a sensor placed at the bottom of the first arm which automatically switches the cylinders to double-acting mode. The operator keeps control of arm movements at all times.

Reverse break-back acts in the event of an erroneous manoeuvre, the arm gives slightly forwards, thus protecting the cylinder from breakage. This system also comes into action if the driver is forced to break heavily when working on a steep downhill slope.

The sliding armrest eliminates friction of the forearm on the rest and reduces flexing and torsion of the operators wrist by 30%.

The quick-attach coupling allows for easy changing of cutter head for saw blade, hedgecutter, drain cleaner etc.

Noremat Magistra Main Frame provides the solution to constantly increasing stresses caused by increased work speeds, even more powerful tractors and higher transit speeds.

Stocker-Crew's entire range of products can be viewed at www.stockercrew.com.au. If you require further information please do not hesitate to contact us.
